AI is here to stay.

For developers, consumers, and businesses

366K+

GitHub stars for
OpenClaw

From zero to GitHub's most-starred software project in under 4 months — surpassing React and Linux.

53%

Consumer adoption of
GenAI

Reached 53% population-level adoption in 3 years — faster than the personal computer or the internet (Stanford 2026 AI Index).

\$37B

Enterprise GenAI
spend (US, 2025)

US companies tripled GenAI spend from \$11.5B to \$37B in one year. 86% of enterprises plan further increases in 2026.

THE RISK

The Attention Economy captured eyeballs. The Memory Economy will capture minds.

If persistent memory of every consumer is owned by AI platforms... we all lose.
Preferences, history, loyalty and intentions, all **locked inside walled gardens**.

For Consumers

Platforms that remember everything about you can manipulate and influence your decisions in ways you don't understand or agree with. Your AI memory becomes their leverage — shaping what you see, buy, and believe, with no transparency or recourse.

For Enterprises

Platform-held AI memory will sit between companies and their customers — disintermediating their most important relationships. What at first seems like a reasonable trade-off for transaction volume will soon become a strategic trap.

This is the Aggregator Trap 2.0 — the same lock-in cycle that created today's monopolistic internet, now repeating with AI.

DISINTERMEDIATION FOR ENTERPRISES

AI is existential: A bigger threat than Web 2.0 ever was

38% of US CEOs

Rank AI as the biggest threat to their business

AI tools primarily used for finance (UK)**

eBay Blocks Use of AI 'Buy-For-Me' Agents

Amazon quietly blocks AI bots from Meta, Google, Huawei and more

Consumers are clear: the absence of AI data controls will limit consumers' AI adoption

85% of consumers say having control over the data that AI shopping agent collects about them is important or very important

1 in 4 consumers would not use an AI service if it required them to share any personal data at all. Only 13% would share financial data to use AI.

Would you still use an agent if you didn't have control over how it uses your data?

57% of US consumers

Are unlikely or very unlikely to shop with an AI agent if they don't have control over how it uses their data

Source: Visa Agentic Commerce Consumer research survey (2025)

Consumer Survey Q14: To use this new service, what personal data would you be willing to share with the company offering it?

Consumer Survey Q315A: "When using AI-enabled e-commerce, the AI Agent may be collecting information about your shopping preferences and purchases. How important is it that you can control or delete how the Agent uses you.

Consumer Survey Q15B: If you cannot control how the Agent uses your data, what is the likelihood that you will still use the Agent?
in US, N=1,600

TWO FUTURES

An alternate AI web is within our grasp

AI is increasingly distributed and embedded in every consumer surface.

User memory & context must be safely accessible by any AI-enabled tool, from any interface.

WHAT'S MISSING

Solid was built for this moment

The tech fits the AI moment and the market is hungry — it's up to us to translate the potential into tangible points of value.

Diverse Context Sources

Memory must handle every type of data — not just AI conversations. CRM, health, calendar, support tickets, and data from connected apps.

Users at the center

Apps and AIs each silo user data independently. There's no architecture that puts the user — not the app — at the center of their own data.

Networked Consent

Memory & context must flow across third-party services with proper consent. That's a multi-party access management problem no one has solved.

Interoperable Identity & Data

One portable ID and a shared data format let any app or AI read and write the same user data — no per-vendor schemas, no lock-in.

What's missing isn't better memory tech. It's an architecture that ensures memory works for the user, not for the platform.

Thank You
