

We Are

Your data, your story

Developing a business model for personal
health data pods

1 May 2026

The only future is a sustainable future

VITO is a science-to-technology partner for a secure and sustainable transition

Circular industry

Biobased materials
Energy & water
Closed loops
Advanced recycling

Healthy living environment

Environment – health impact
Space for all
Quality of life

Resilient societies

Climate mitigation
Climate adaptation
Security

The health data ecosystem is too fragmented

which leads to multiple problems

Patients repeat their story over and over.

Doctors lack complete information.
Limited follow-up outside the medical centre.

Research has limited access to standardized, non-clinical lifestyle real world data.

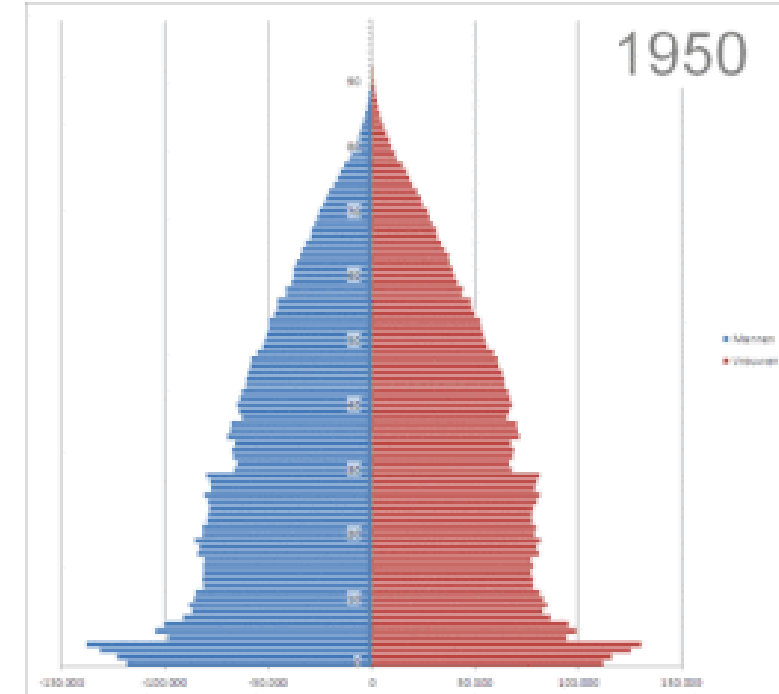

Governments lack prevention insights.

Results: inefficient care, high costs, low trust

The healthcare system is under enormous pressure

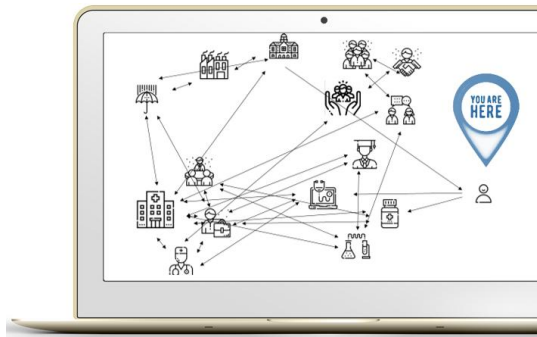

- Shift to preventive & personalized healthcare brings a large need of citizen generated real-world data
- Explosion of health data (wearables, apps, IoT)
- Regulatory push (GDPR, EHDS, AI Act)
- Growing trust crisis in data use

 **The system needs a new data model**

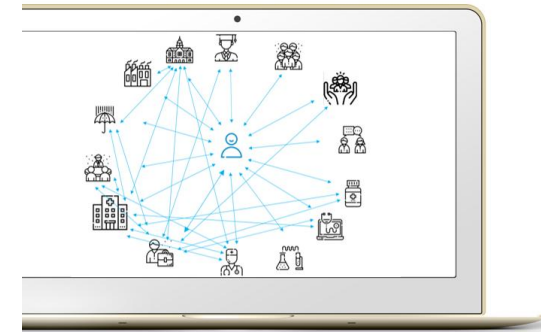

Cost of aging population by 2050 in Belgium: +€29 billion
In the next legislative term (2025-2030): +€5.2 billion (VOKA, 2024)

From fragmented care to a citizen-driven ecosystem with connected care

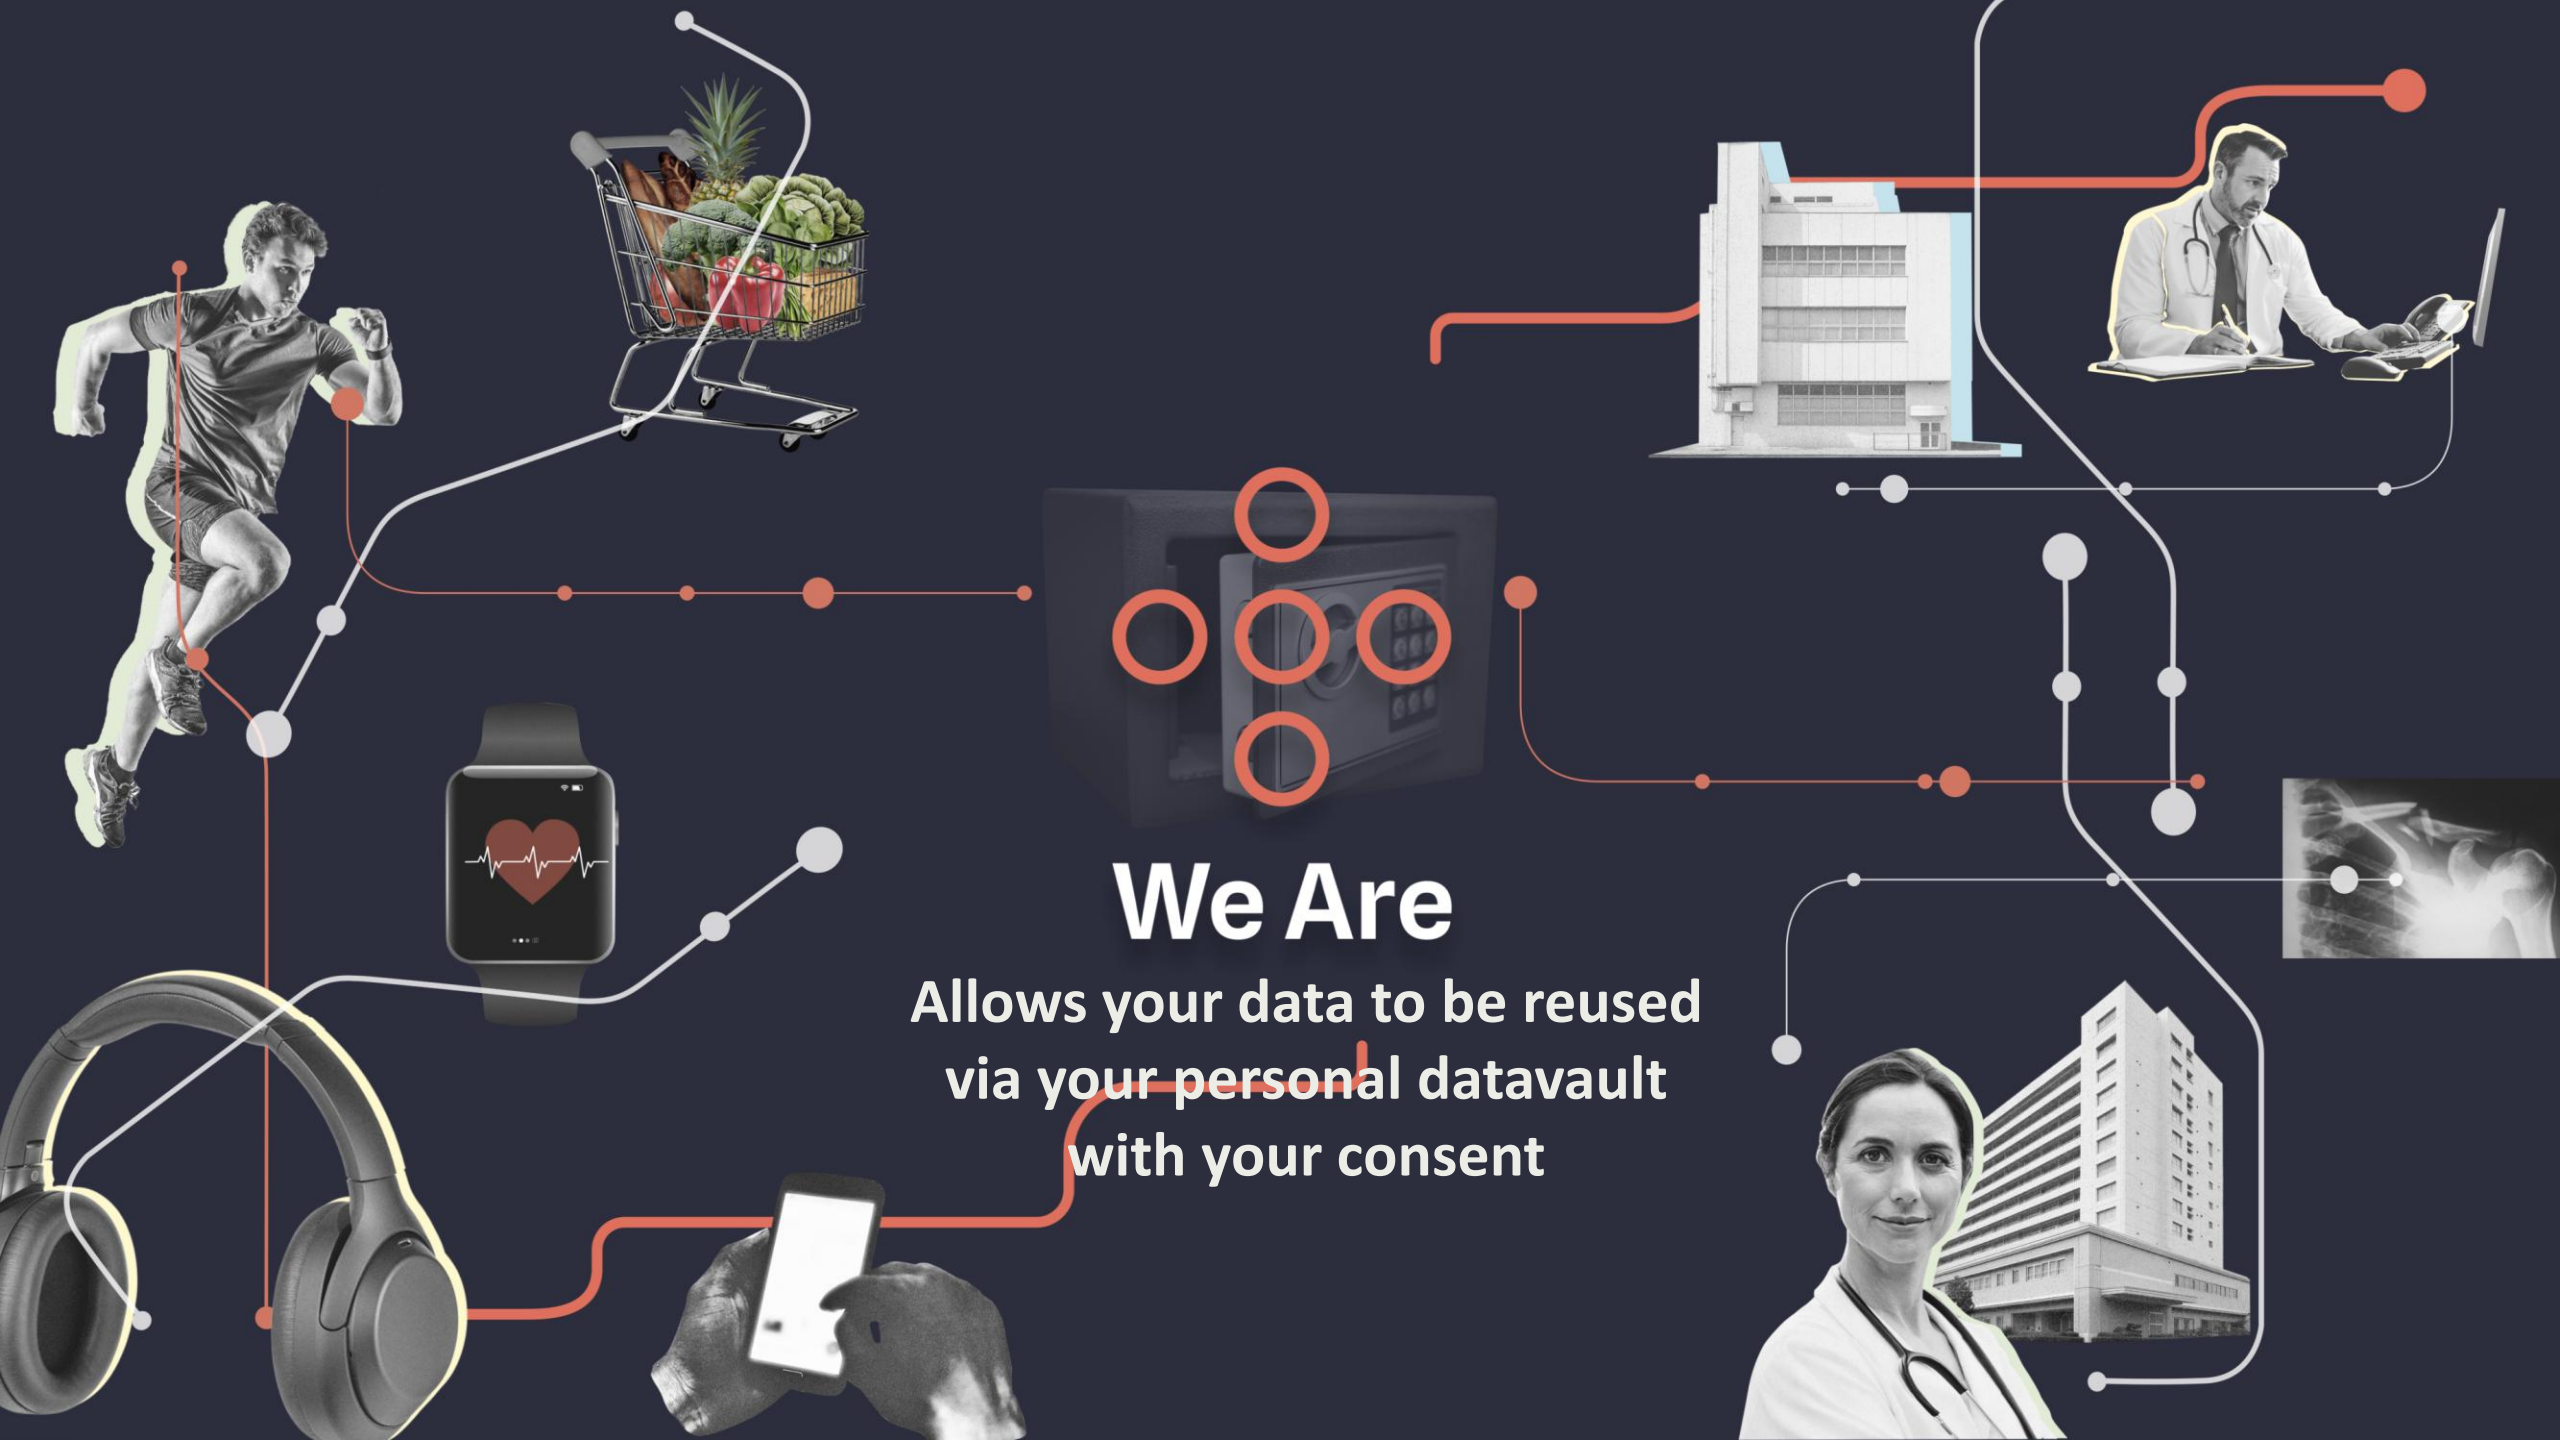

'About' the patient
in a **disease-oriented** care
system

'Together with' the citizen in
a **Quality-of-Life** oriented
care system

**Citizens at the center
of their data**

We Are

Allows your data to be reused
via your personal datavault
with your consent

We Are enables citizens to control and share their health data securely

- Personal data vaults
- Consent-based data sharing
- Trusted governance framework

 **Data is not owned by platforms, but controlled by citizens**

How it works

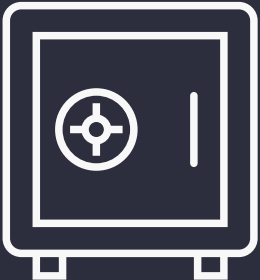

Citizens gives consent
in We Are portal

Data is generated
(apps, sensors,
wearables)

Citizen consents to store
data in personal data
vault

1

to share data with care
providers

2

to aggregation and
pseudonmization of data for
secondary use (R&D)

3

to data reuse between trusted
apps to get personalised
health advice

Results in more health literacy, integrated care, better health outcomes

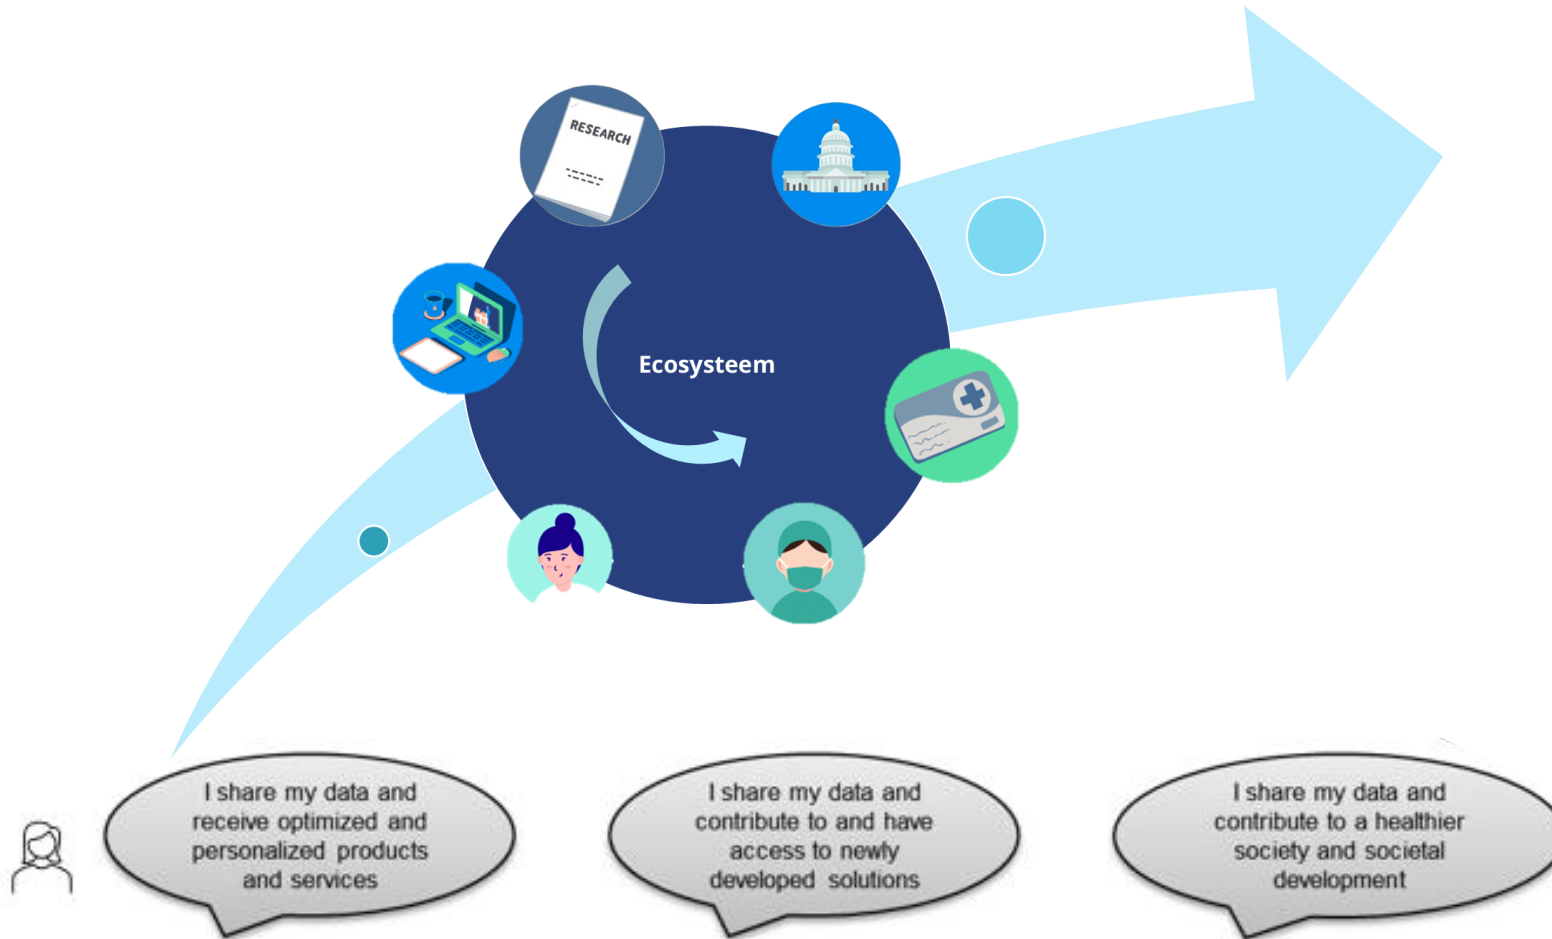

We make impact together: use cases

Use cases	Dataflow after consent
Clinical trials	Personalised matching with clinical trials Follow-up during clinical trials (burden of disease) Data linkage between (retrospective) clinical data and personal lifestyle data (RWD) via EHR connectors
Personalised lifestyle advice	Integration of data from wearables/sensors/EHR's in health applications such as Intelliprove, Multiscan, Hylight, Mirror. Report, Bloomup, Medhive, Synapse, Zipster,...
Hybrid care pathways	Digital remote monitoring of chronic patients e.g. diabetes, cardiovascular diseases, oncological aftercare, neurological diseases, COPD,...
Bi-directional exchange of data in and between welfare and healthcare sector	Only once principle in the welfare sector (mental care, sociale housing, child protection services, social care, jobcentres, integration services etc....) + exchange with your personal GP or link worker
Early detection, early intervention strategies, predictive models	Data for digital twins, pharmacogenomic passport, physical readiness of military personnel, sports athletes,....
Value-based patient-centred healthcare	Quality measurements (PREMs, PROMs), implementation of patient-centred decision support tools (e.g. Goal Seeker)
Population health management	Community digital preventive care Healthy neighbourhoods Prevention policies and action plans
Population studies	Integrating diverse data sources (clinical, infection history, lifestyle, quality-of-life, environmental and exposure data,...) to better understand pathways from infection to NCD onset.

Value creation

Through trust and reuse of data

Citizen

Control and better health outcomes

Healthcare

Efficiency and better decisions

Research

Access to real-world data

Industry

Faster innovation

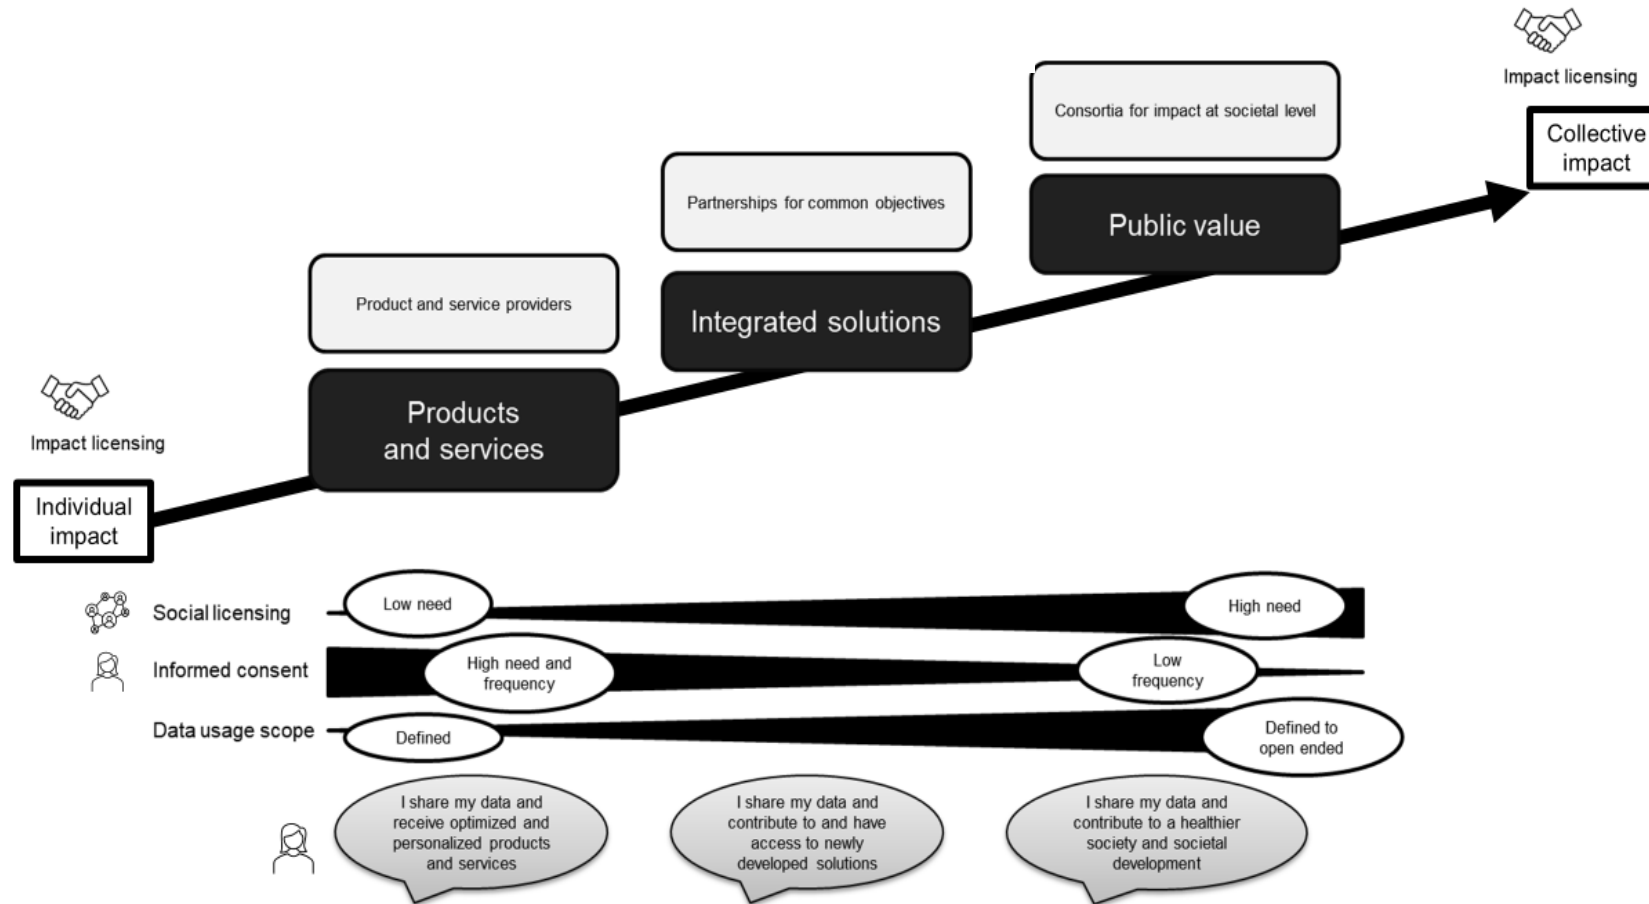

Policy

Better policies and prevention

Developing the business model

Value creation on different levels

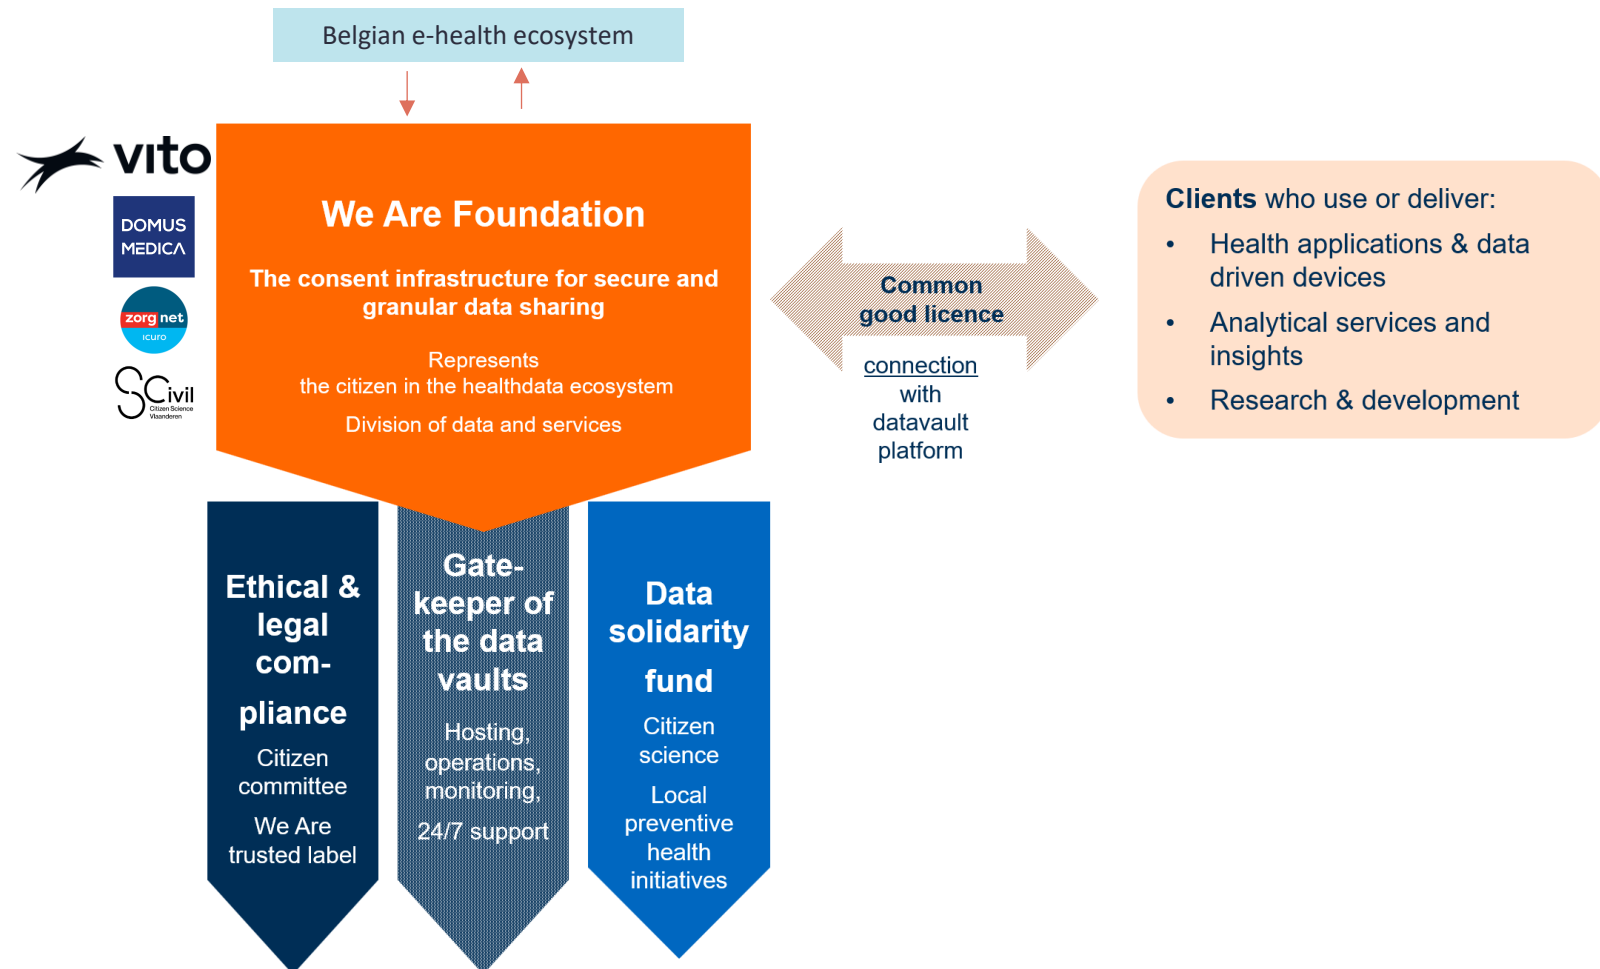

We Are Foundation

a foundation of public benefit to ensure collective impact

Start in Q3 2026

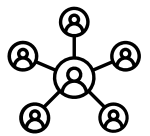

Why a foundation of public benefit?

- Public trust & legitimacy via “mission lock”
 - Mission protected by legal recognition (Royal Decree)
 - Citizen-centric governance with real participation

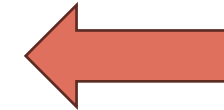

- Independence, neutrality & non-profit
 - Independent from commercial & political interests
 - Neutral steward for data governance & ethics
 - Revenue reinvested in the platform and the Solidarity Fund

- Long term social impact
 - Data Solidarity Fund supports public-interest initiatives
 - Focus on digital inclusion, ethics & citizen science
 - Value creation beyond economic returns

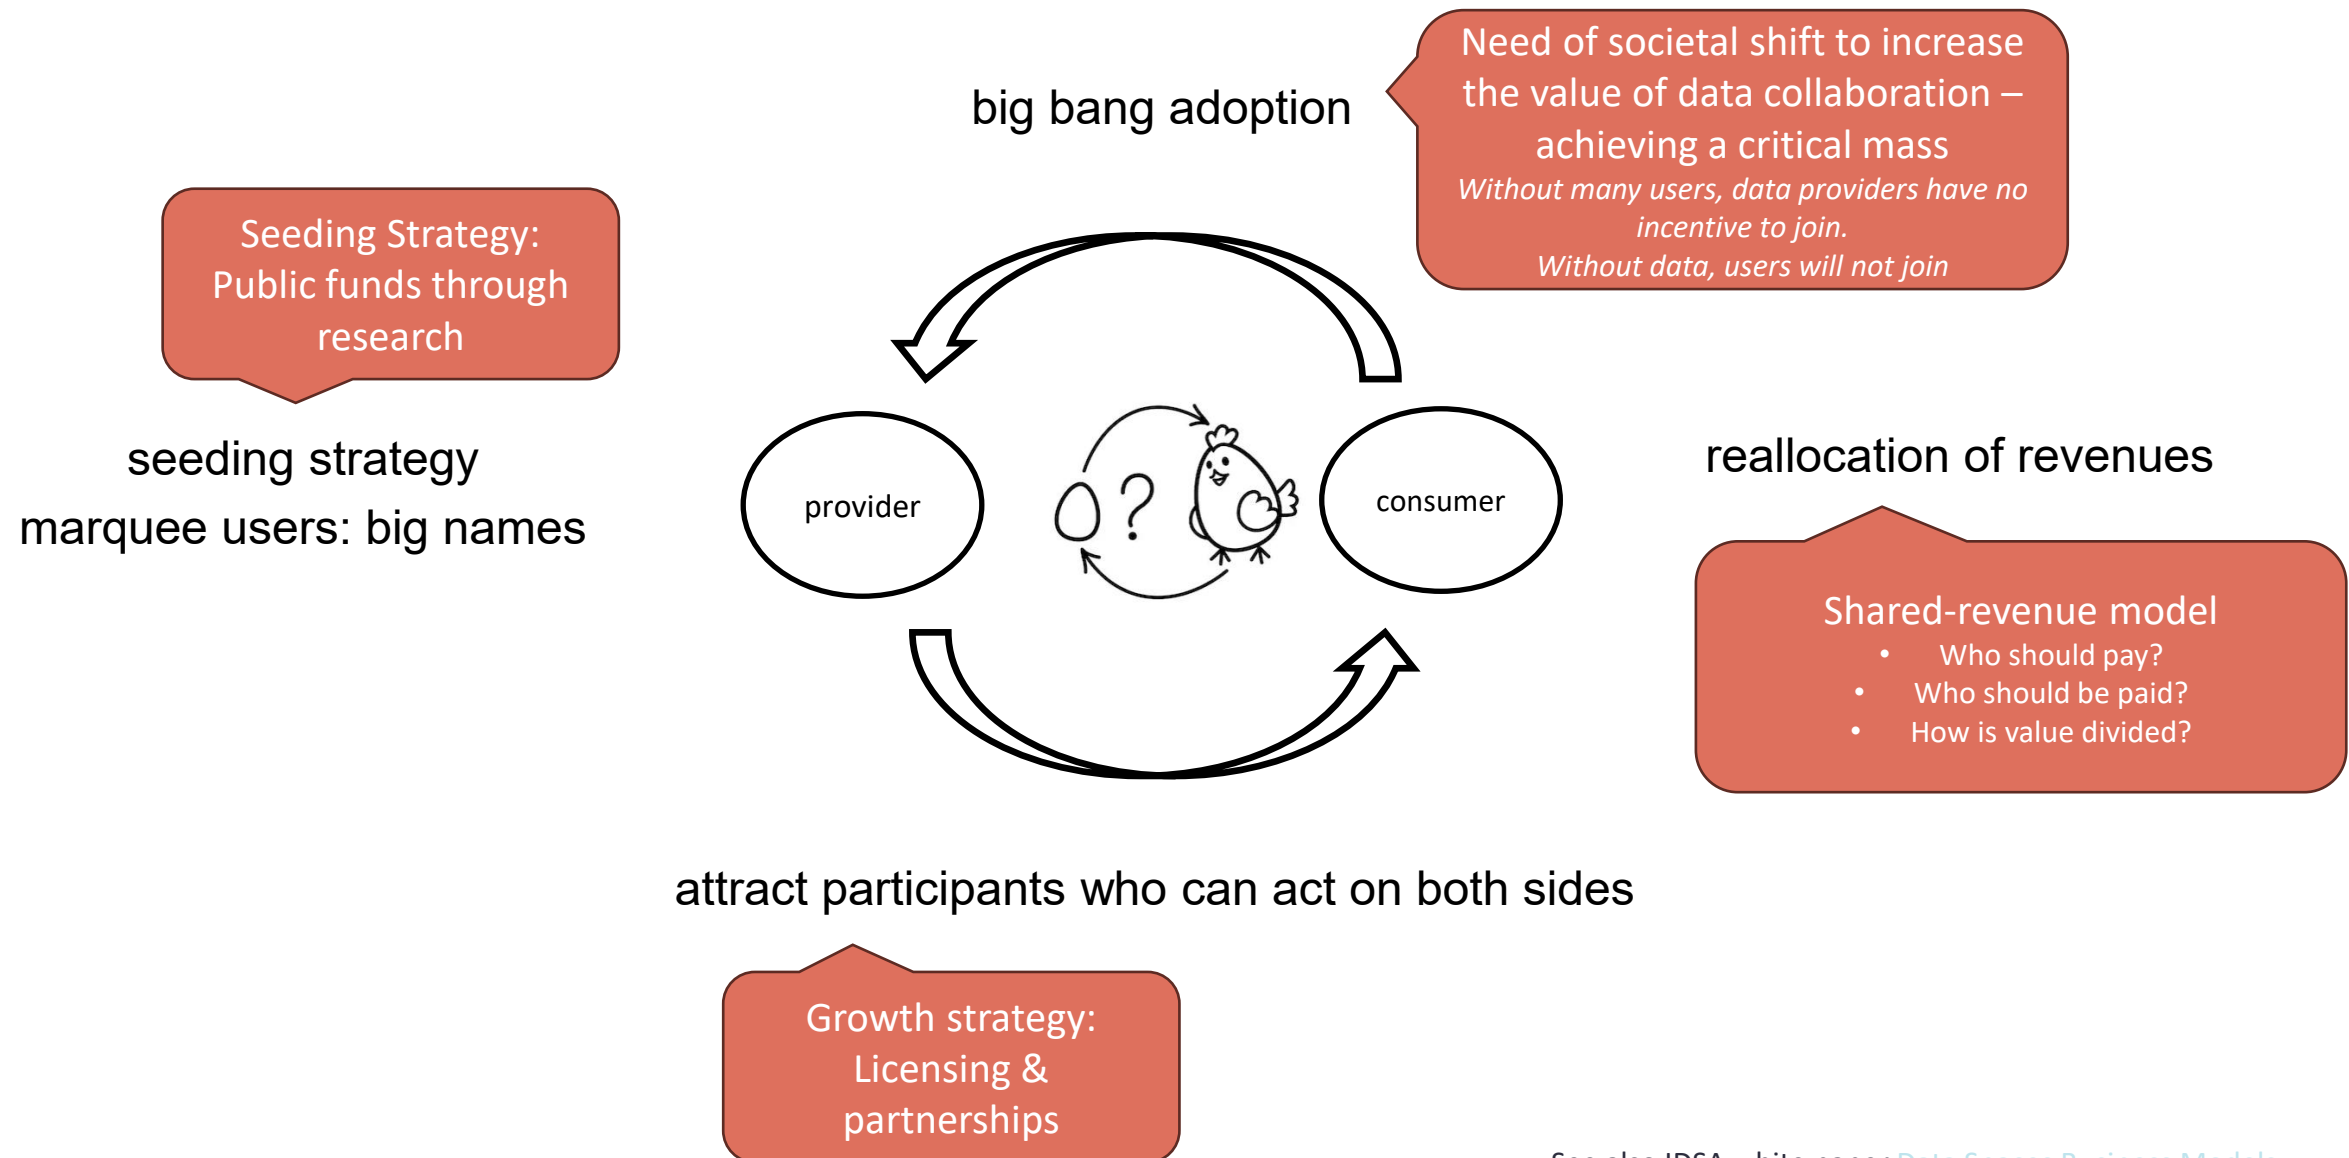

- Lean & efficient governance:
 - Agile and streamlined structure – e.g. no general assembly
 - Accountability ensured

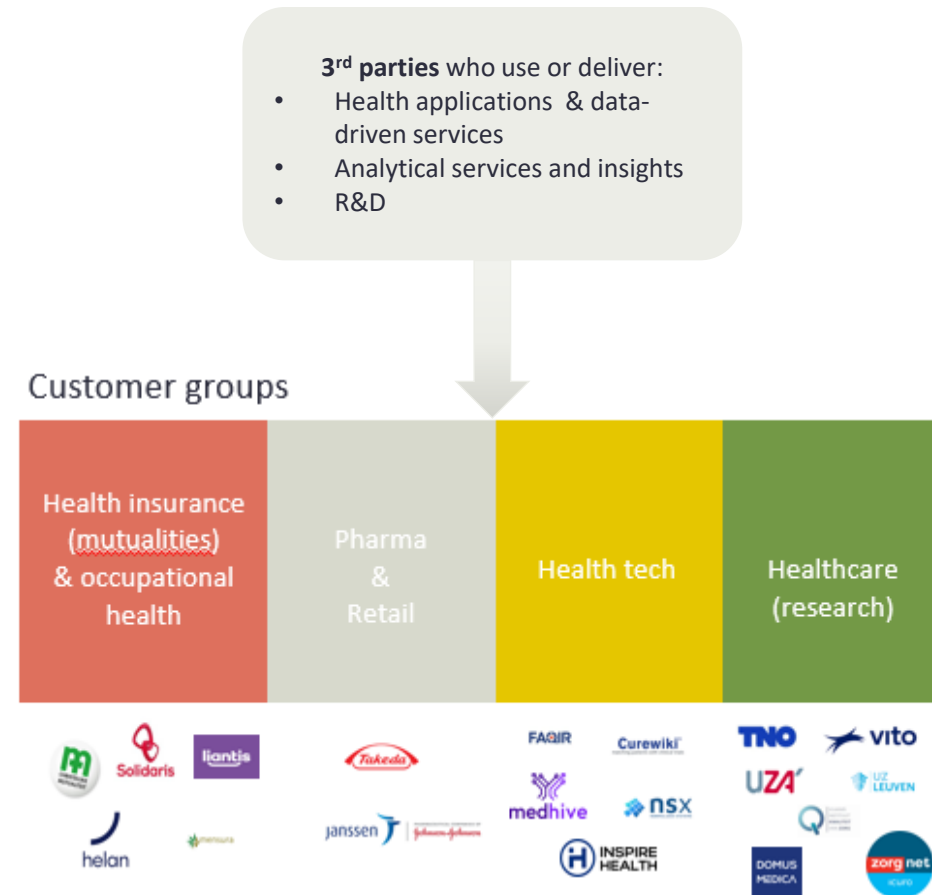

This is what the market demands.

Challenges for dataplatforms?

Business model

- Data, can be used multiple times, generating value upon each use
- A data transaction (= writing and reading data from/to the We Are pod) creates value
- No monetization of data
- Citizens: free
- Organizations pay the We Are Foundation for:
 - Connection with the platform
 - Trusted data collaboration
 - Services (E-health connectors, support, compliance via the We Are label)

- Stimulates adoption & transactions
- Simple pricing
- Scalable to transaction fee once there is traction
- Creation of network effect (every new pod increases the value of the whole system)

Business model evolution

From form to ecosystem

Phase 1 – Access fee

- Fee per pod to launch the system
- Common good license (monthly – annual access fee)
- Tiered pricing (care, R&I public, commercial (pharma, medtech, AI))

Phase 3 – Ecosystem model

- Shared revenue – value based pricing
- Data-driven services (AI, insights, products)
- Steward-owned company as a daughter of the Foundation

Phase 2 – Membership model (Club)

- Pay for ecosystem participation
- Co-create solutions
- Shared revenue – value based pricing

Long term perspective:

steward-owned company as a 'daughter' of the We Are Foundation

Leading principles of steward-ownership:

- **Mission first**
Purpose over profit; profit serves the mission
- **Control by stewards**
Decision power with active, responsible leaders—not investors
- **Capped returns**
Fair but limited profit distribution
- **No free sale**
Ownership is not tradable or speculative
- **Long-term focus**
Independence enables sustainable value creation

Examples

Novo Nordisk A/S

Industrial
foundation-owned
Denmark

Carlsberg A/S

Industrial
foundation-owned
Denmark

Sharetribe Oy

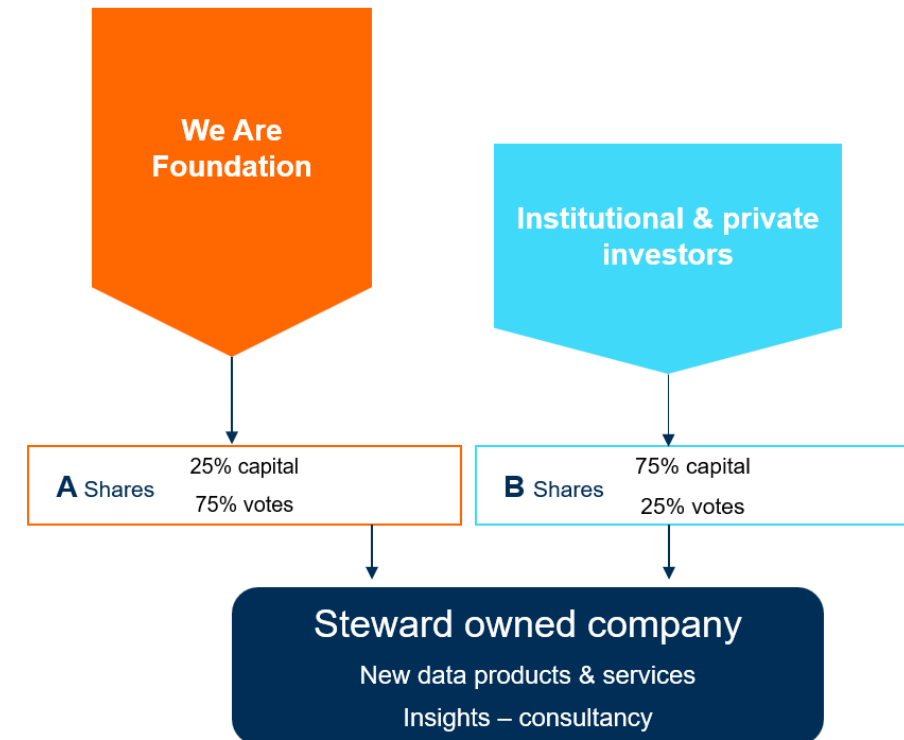

Golden Share
model
Finland

Robert Bosch
GmbH

Trust-Foundation
structure
Germany

Start of the road to success

2+M EUR
seed funding

Using the funds to execute our strategy

Start:

Flanders market entry with legal entity establishment

- 3-5 hero use cases
- Onboarding 10.000 citizens on the data vault platform

Sales:

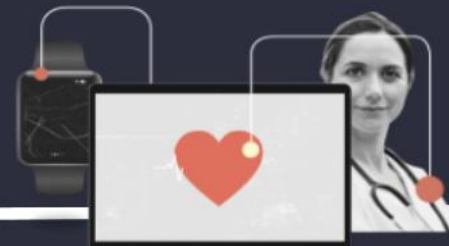

Expanding marketing & sales with strategic partnerships

- 3M revenue 2026-2027
- Club model with data collaborations for new data products

Tech:

Scaling and upgrading SOLIDpod technology

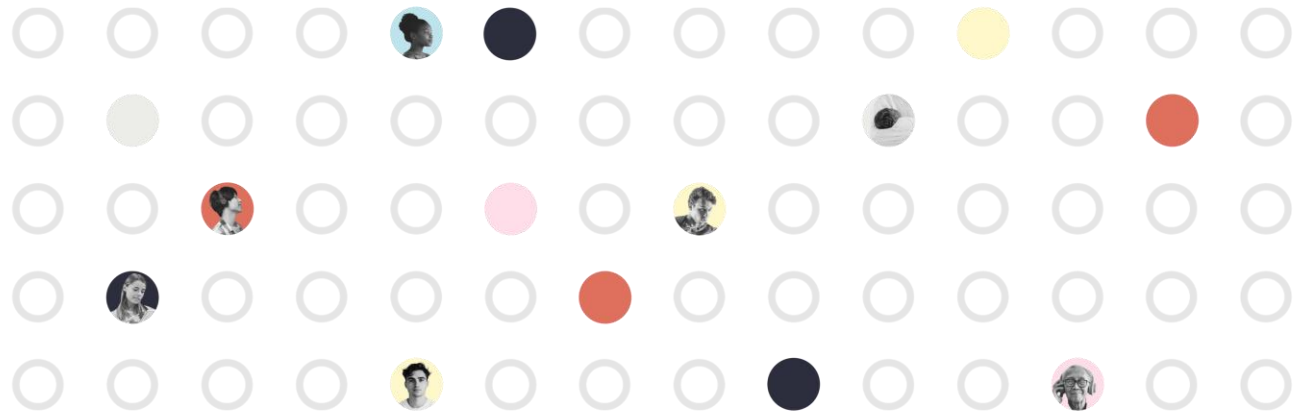

- EHR connectors
- Agentic AI
- ...

Discussion

- What would make you join this ecosystem?
- What role would you play?
- Experiences with value-based pricing?
- How can we organize ourselves in the SOLID community to work together?

Let's shape this together!

We Are

Jouw data,
jouw verhaal.
